\* L/R = 31  $\mu\text{H}/\Omega$

The tables give the maximum permitted cable parameters (including cable and load) for hazardous-area circuits in group IIC and IIB gases. However, the tables are by no means exhaustive and for full details of other safe combinations, consult either BASEEFA system certificates Ex832469, Ex92C2374 or Ex92C2376 or MTL. The MTL702 is covered by BASEEFA system certificate Ex842308, and the MTL706 by Ex872513.

In practice cable parameters rarely present a problem, as all cables normally used for instrument interconnection have L/R ratios below 25  $\mu\text{H}/\Omega$  and capacitance below 200pF per metre.

**Note 1** If values are not quoted for when an earth return is not used, those for an earth return ('Yes' in the table) can be used.

**Note 2** The maximum power that can be drawn from the barrier combination under fault conditions. Used for assessing the temperature classification of 'simple' hazardous-area apparatus.

**Note 3** The values of the parameters for Groups IIA and IIB can be found in certificate numbers BASO1ATEX7202 and BASO1ATEX7203.

For FM permitted combinations, refer to MTL document SCI-88 (via FM ref 1H8A1.AX).
